**Subject:** Fwd: NITROUS OXIDE

**NITROUS OXIDE A GROWING THREAT TO CLIMATE (Globe and Mail, Oct.9/20, p. A12)**

The article highlights the increasing (and long-lasting) emissions from this greenhouse gas in fertilizer.

Farmers are using it to increase yield threatened by weather and other factors.

Nitrous oxide lingers in the atmosphere 10 times as long as methane (more than a century).

When it breaks down, it creates ozone-depleting byproducts.

**Questions:**

1. How widespread is its use in Grey County?
2. How can we find out?
3. Is it an ingredient in Round-Up? [REDACTED]
